

# Universal Domain Deployment SOP

## 1. NAMECHEAP SETUP

- Set Nameservers to Namecheap BasicDNS if needed
- Add A Record: @ --> 76.76.21.21 (Vercel IP)
- Add CNAME Record: www --> cname.vercel-dns.com.
- If using Vercel DNS, Vercel handles this automatically.

## 2. GITHUB SETUP

- Create a repository named after the domain
- Upload these files:

README.md, LICENSE, vercel.json, .env.local.example, /pages, /public

## 3. VERCEL SETUP

- Import project from GitHub
- Add domain (root + www)
- Set www as primary
- Deploy

## 4. TEST

- Visit the deployed domain
- Confirm GitHub push triggers Vercel redeploy

Use this for every domain. It never changes.
